

German Weather Service (“DWD”) claims “relentless climate change” in Germany

Quote: “The long-term trend of climbing temperatures is continuing relentlessly in Germany and worldwide.” (May 3, 2012: *DWD* Vice President Dr. Paul Becker)

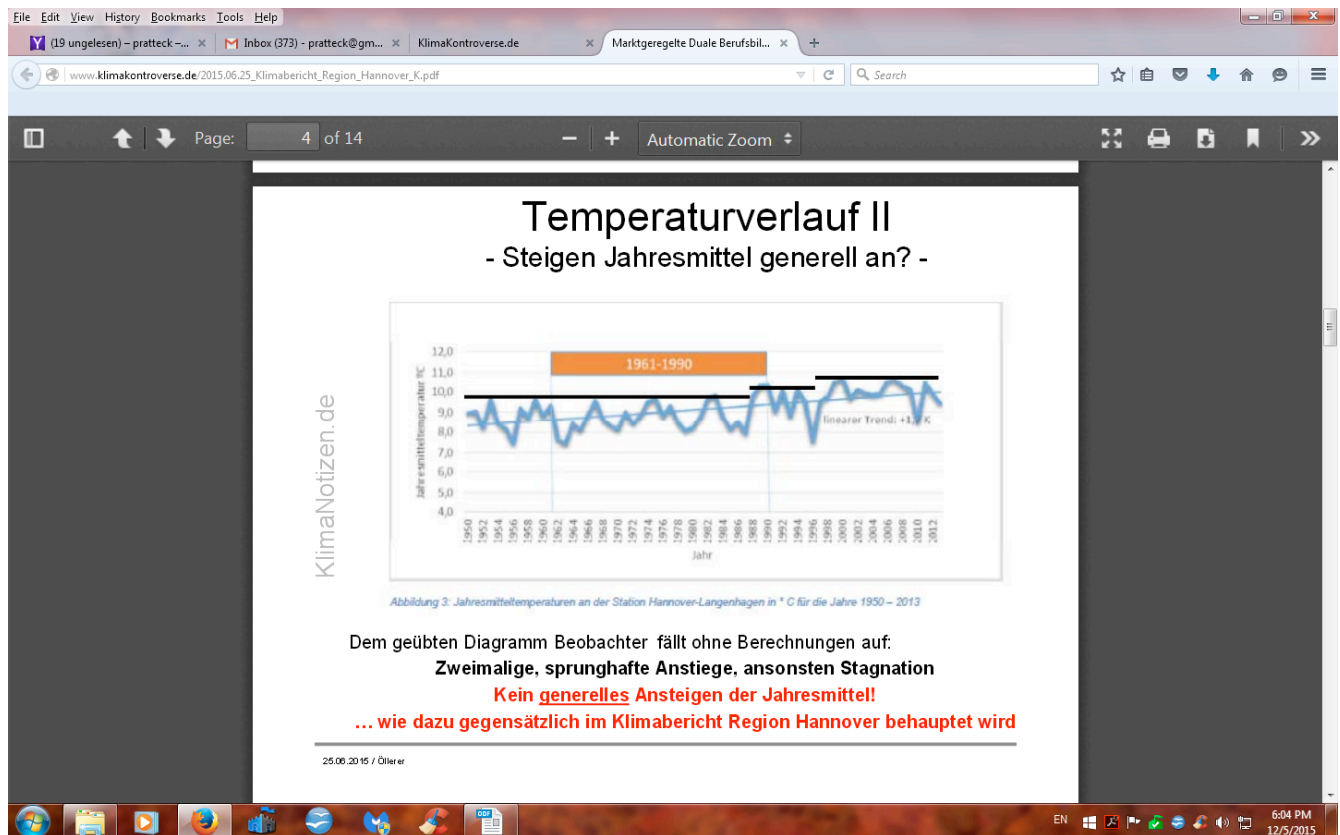

The facts: Stagnant temperatures since 1997. No temperature rise occurring. Yearly fluctuations averaging out. Sinking winter temperatures since 1997.

Two stair-steps of warming in Germany:

Since 1951 there have been just two instances of lasting warm-ups in Germany: 1987 and 1997! That contradicts the greenhouse thesis, since CO₂ is constantly climbing. No known studies of this phenomenon are extant. (Source: *DWD* data)

(above-graph caption: “Temperature progression II: Are annual means generally rising?”)

(below-graph text: “Immediately evident to the trained observer, without calculation: **Two instances of sudden jumps, otherwise stagnation. No general rise in annual mean temperatures...contrary to claims made in the report for the Hannover Region.**”)

Summary

Official climate science, including its *DWD* component in Germany, is covering up:

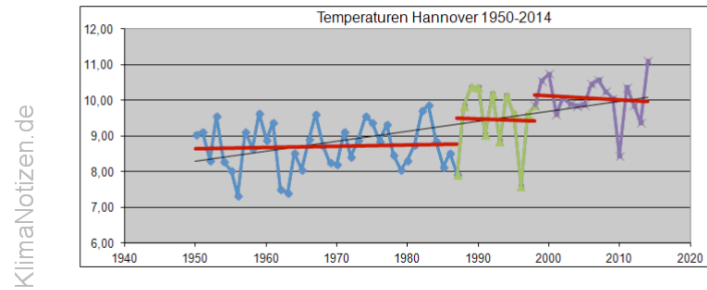

- the absence of warming since 1997
- the absence of lasting warm-up in 63 of 65 years since 1951
- the two temperature step-ups in 1987 and 1997
- the absence of research into these temperature step-ups
- the incompatibility of the temperature step-ups with the greenhouse thesis

- Recalculation Hannover 1950-2014)

(below-graph text: Reality: No lasting temperature rise in about **63 of 65 years!**)

Confirming fact check: **No general rise in annual means!**

Temperaturverlauf III - Neuberechnung Hannover 1950-2014 -

Realität:
Keine dauerhafte Temperaturerhöhung in etwa 63 von 65 Jahren!
Bestätigung Faktencheck: **Kein generelles Ansteigen der Jahresmittel!**
