

NASA AND NOAA CAUGHT IN CLIMATE DATA MANIPULATION; NEW REVELATIONS HEADLINED ON KUSI-TV CLIMATE SPECIAL

Climate researchers have discovered that NASA and NOAA scientists improperly manipulated data in order to claim 2005 as "THE WARMEST YEAR ON RECORD." KUSI-TV meteorologist, Weather Channel founder, and iconic weatherman John Coleman will present these findings in a one-hour special that aired on KUSI-TV on Jan.14 at 9pm. A related report is available on the Internet at www.kusi.com.

Climategate comes to the United States in this new report by computer expert E. Michael Smith and Certified Consulting Meteorologist Joseph D'Aleo. They discovered extensive manipulation of the temperature data by the U.S. Government's primary climate center: the National Climate Data Center (NCDC) in Asheville, North Carolina. Smith and D'Aleo found NOAA manipulated temperature data to give the appearance of warmer temperatures than actually occurred by trimming the number and cherry-picking the location of weather observation stations. The preliminary report supported by SPPI is available online [here](#). Final report will be posted on the SPPI website soon.

The number of actual weather observation points used as a starting point for world average temperatures calculations was reduced from about 6,000 in the 1970s to about 1,500 now. "That leaves much of the world unaccounted for. The greatest losses were in areas where, NOAA and the other data centers claim the warming was the greatest like Siberia and Canada," according to D'Aleo, who adds "In these regions, NOAA 'estimates' temperatures based on stations that may be 700 miles away.

E.Michael Smith notes "When doing a benchmark test of the program, I found patterns in the input data from NCDC that looked like dramatic and selective deletions of thermometers from cold locations." Smith says after awhile, it became clear this was not a random strange pattern he was finding, but a well designed and orchestrated manipulation process. "The more I looked, the more I found patterns of deletion that could not be accidental. Thermometers moved from cold mountains to warm beaches; from Siberian Arctic to more southerly locations, and from pristine rural locations to jet airport tarmacs. The last remaining Arctic thermometer in Canada is in a place called 'The Garden Spot of the Arctic,' always moving away from the cold and toward the heat. I could not believe it was so blatant and it clearly looked like it was in support of an agenda," Smith says.

This problem is only the tip of the iceberg with NCDC data. "For one thing, it is clear that comparing data from previous years, when the final figure was produced by averaging a large number of temperatures, with those of later years, produced from a small temperature sampling with lots of guesswork, is like comparing apples and oranges," says Smith. "When the differences between the warmest year in history and the tenth warmest year is less than three quarters of a degree, it becomes silly to rely on such comparisons," added D'Aleo who asserts that the data manipulation is "scientific travesty" that was committed by activist scientists to advance the global warming agenda.

Smith and D'Aleo are both interviewed as part of a report on this study on the television

special, "Global Warming: The Other Side" seen at 9 PM on January 14th on KUSI-TV, channel 9/51, San Diego, California. That program can now be viewed via computer at the website <http://www.KUSI.com>.
