

New Horizon Photos of Jupiter's Second Red Spot and Volcano on Io

Several discoveries have been made from images captured in late February by the New Horizons probe in what NASA scientists called "a real-world fly-by" of Jupiter, 16 months into its mission to Pluto.

They also got the closest look yet at the "Little Red Spot," an Earth-sized swirling storm that scientists described as a galactic rendition of Vincent Van Gogh's "Starry Night" painting, and dramatic views of volcanic eruptions on Jupiter's moon Io.

Here you see that second red spot.

Note similarity to Van Gogh's *Starry Night* painting

The fly-by of the moon Io captured ash from a volcano that reached as high as 200 miles above the surface.
